The neuroethology of escape in crabs: from sensory ecology ...

Highlights Escape behaviour of crabs is highly dependent on behavioural context. Lobula Giant neurons predict the strength and timing of crab escape. Contextual information under natural conditions is complex and dynamic. Escape behaviour of crabs is modulated by associative learning.

Neural Integration and Behavior examines the best neuroethologically researched systems in crustaceans. Research on these systems varies, with emphasis placed on physiological or behavioral aspects. The book places less emphasis on behavior and more on the interactions between neural elements. It presents information gathered from each system and its contribution to the nervous system.

Neural Integration

Neural Integration is an adaptation of numerous, well established, proven but relatively gentle (non thrust) techniques most of which are not in common use today, and does not resemble chiropractic as most people recognise it.
